(Wyo.)-New Data, But Not Much New In Fracking Study

By: Roxie Graham-Marski Posted at: 09/28/2012 10:39 AM

CHEYENNE, Wyo. (ASSOCIATED PRESS) - Environmentalists and the petroleum industry haven't changed their minds about any damage done by hydraulic fracturing to the groundwater in Wyoming.

That's despite new groundwater sampling data the U.S. Geological Survey has released from the gas-drilling area of Pavillion in west-central Wyoming.

The new data follows a U.S. Environmental Protection Agency report last year that theorized fracking might have affected the groundwater in that area.

Fracking blasts water, sand and chemicals deep into well holes to open fissures and improve the flow of oil and gas. Some Pavillion-area homeowners say their well water stinks of chemicals.

The Natural Resources Defense Council says the new data still shows fracking is a threat. Pavillion gas field operator Encana says the new data still shows that drilling and fracking didn't affect the groundwater.
